

HNB MediSkin

VITAL SKINCARE FOR HEALTH AND BEAUTY

Dear Friends,

We hope you are all doing swell and enjoying spring so far! I know that we tend to get so caught up between getting our taxes filed and trying to get through our current economy crisis, that we just forget to make time to just relax. Our mission here at HNB MediSkin is to be able to provide excellent and affordable services to our clients. We strive and work hard towards giving each of our clients the results they are looking for. If you are able to make some time this month to come in for a 60 min facial not only will we provide you with a facial but we will also include a mini shoulder and neck massage, and some of our Dr. J SkinClinic product samples. You will get all of this for only \$30! If you are looking for something extra we also have our Mothers Day Promotion starting on April 1st. Details are listed below. If you would like to schedule an appointment please call 714-533-3737. We are looking forward to your next treatment with us.

Funny quote of the Month

"Isn't it appropriate that the month of the tax begins with April Fool's Day and ends with cries of 'May Day!'"

-Author Unknown

Skin Pigmentation

Skin pigmentations can make people feel both depressed and embarrassed. The sun is a critical influence in the development of skin pigmentation. In this issue, typical types of skin pigmentations will be introduced. The most typical types are melasma, vitiliago, and solar lentigo.

☐ Melasma:

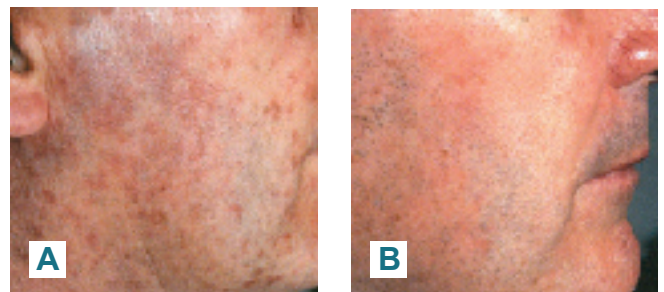

A hyperpigmentary skin disorder such as dark spots or blotches on the face, forehead and neck. About 5 to 6 million American women have melasma, mostly women between the ages of 20 to 39. It occurs in 50 to 70% of pregnant women. This disorder is triggered by both sun exposure and hormonal changes during pregnancy. Melasma may fade naturally, but there are treatments to consider if it doesn't.

☐ Solar Lentigo:

Solar lentigines, also called sun, age, or liver spots, are benign flat brown spots that look like large brown freckles. They appear on sun-exposed skin, such as the face or back of the hands. In general, 90% of light skinned people over the age of 60 will develop the condition. Those who are most likely to have solar lentigines are people who have a tendency to sunburn and tan little or not at all (skin types 1 and 2). This is a skin condition caused by chronic exposure to the sun or UV rays.

☐ Vitiliago:

Vitiliago is a hypopigmentation disorder (where the body does not produce enough melanin) that creates smooth white spots on the skin. The condition affects nearly 2% of the population, typically striking those between the ages of 10 and 30, and occurs most among those with darker skin. The cause of this condition is still unknown. Though many people report pigment loss shortly after severe sunburn, the cause is likely a combination of genetic, immunologic and neurogenic factors. There is no current cure for vitiliago but treatments forms have improved over the years.

Actinic Keratosis. Baseline A) 2 week post GAP treatment. B) Reference from chemical peel.
